We test composites

Be it parts of hip joints or wind turbines, yachts or sewer pipes: Plastics from almost any application are tested thoroughly in the test lab of Siebert+Knipschild GmbH.

Our modern equipment allows us to perform a broad range of analysis methods. We offer physical, analytical and optical tests, such as 3D microscopy, differential scanning calorimetry (DSC analysis) or dynamic-mechanical analysis (DMA).

Our test lab is officially accredited by the German Accreditation Agency (DAkkS).

We are at your disposal in three sites in Germany.
